Predict risk for a new migration case

StratifiedGroupKFold 5 folds × 5 repeats · grouped by service · balanced class weights

Prediction model

Logistic Regression (primary) 1

Environment	Service category	Business criticality	Complexity level (1–5) 2
Dev	Integration	Medium	5

Database dependency	Database type	Network change required	Firewall rules count
Yes / No	MySQL	Yes / No	2

External integrations count	Route/Ingress changed	Environment config change	Owner availability
4	Yes / No	Yes / No	Delayed

Previous issues count

Class probabilities

Why this classification? 5

Show all contributions ▾

Exact linear additive attribution toward the predicted class (positive pushes toward it).

Recommended actions 6

- R1 **Validate DB connectivity** because: Has_DB_Dependency = 1
- R2 **Verify firewall / network rules** because: Has_Network_Change = 1
- R7 **Schedule extended validation window** because: __prediction__ = High
- R3 **Confirm owner availability** because: Owner_Availability = Delayed
- R6 **Test external integrations** because: External_Integrations_Count = 4
